

CODE AND SUMMARY OF CLASS 1

Sahir Ahmed Sheikh

Saturday (2 – 5)

Teachers:

Muhammad Bilal And Ali Aftab Sheikh

Code And Summary Of Class 1 – Saturday (2 – 5) | Quarter 3

Today was our first Quarter 3 class on Python.

First, our instructor introduced himself to the new students and explained that we would be covering Python using the **Panaverse** repository. The repo link is:

<https://github.com/panaversity/learn-modern-ai-python.git>

Key Points from the Class:

- Python needs to be completed within 4 weeks, after which we will move on to AI.
- We started with **Step 00**, which covers **Python Colab**.
- The repository [learn-modern-ai-python](https://github.com/panaversity/learn-modern-ai-python.git) contains structured steps for learning Python.
 - Inside **Step 00**, there is a subdirectory for **Google Colab**.
 - Within this, there are multiple steps from **Step 01 to Step 15**, covering various topics:
 - **Step 01**: Introduction to Python
 - **Step 02**: Data Types
 - And so on...

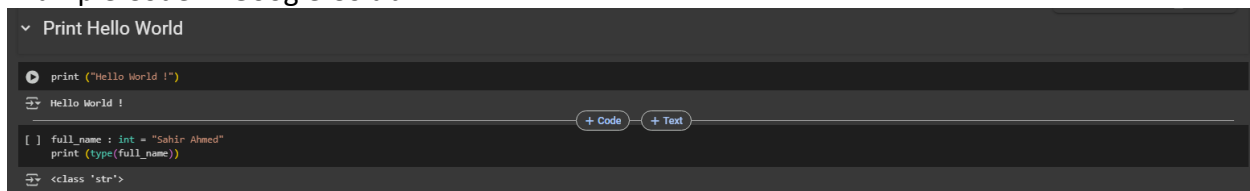

Google Colab: Introduction & Usage

Google Colab is a free cloud-based environment **that allows us to write and execute Python code in our browser. It is mainly used for** machine learning, data science, and AI projects **since it provides** free access to GPUs and TPUs.

How to Use Google Colab

1. Search **Google Colab** in your browser and open the second link (🔗 colab.google).
2. Click on **New Notebook** to create a Python notebook.
3. In the top-right corner, click **Connect** to assign RAM.
4. You can create **multiple code cells** to write and execute Python code.
5. You can also add **text cells** (Markdown) to write explanations separately.
 - In **VS Code**, we use # for comments, but in Colab, we can directly use text cells.

Example Code in Google Colab:

```
Print Hello World
print("Hello World!")
Hello World !
+ Code + Text
[ ] full_name : int = "Sahir Ahmed"
print (type(full_name))
<class 'str'>
```

Markdown Basics (for text formatting in Colab)

- # for **Headings**
- ****Bold**** for **Bold Text**
- **Italic** for *Italicized Text*
- - for Bullet Points
- 1. for Numbered Lists

CPU vs GPU vs TPU

We learned about **CPU**, **GPU**, and **TPU** with diagrams.

CPU (Central Processing Unit)

The **CPU** is the brain of a computer that handles general-purpose processing. It is designed for sequential tasks and executes a few complex instructions at a time.

Key Features:

- **One Task at a Time:** CPUs process tasks **sequentially**, meaning they complete one instruction before moving to the next.
- **Best for Complex Tasks:** Since CPUs have powerful cores, they are optimized for **single-threaded** and complex computations.
- **Manages General System Operations:** The CPU is responsible for handling OS operations, running applications, and performing logic-based tasks.

Common Uses of a CPU:

- Operating system management
- Running software applications
- Handling logic-based calculations
- Managing memory and input/output operations

GPU (Graphics Processing Unit)

The **GPU** is a specialized processor designed for handling **parallel processing**. Unlike CPUs, GPUs consist of thousands of smaller cores that work together to handle multiple tasks simultaneously.

Key Features:

- **Parallel Execution:** A GPU can execute many tasks **simultaneously**, making it ideal for workloads that require massive data processing.
- **Ideal for Simple, Repetitive Tasks:** It excels in processing large amounts of data where the same operation is performed multiple times.
- **Transfers Blocks of Data Easily:** Because GPUs are optimized for handling large datasets, they can move and process blocks of data efficiently.
- **Used in AI, Gaming, and Video Processing:** GPUs power deep learning, 3D rendering, cryptocurrency mining, and real-time graphics processing.

Common Uses of a GPU:

- Machine learning and deep learning computations
- Gaming and rendering high-quality graphics
- Video editing and processing
- Simulations and big data analysis

TPU (Tensor Processing Unit)

A **TPU** is a specialized AI accelerator chip developed by **Google** for handling machine learning workloads efficiently. It is optimized specifically for **tensor operations**, which are heavily used in deep learning models.

Key Features:

- **Designed for Machine Learning:** TPUs are built specifically for AI workloads and outperform GPUs in training deep learning models.

- **Optimized for TensorFlow:** Since TPUs are developed by Google, they are deeply integrated with TensorFlow, making AI training and inference much faster.
- **Higher Energy Efficiency:** TPUs consume less power compared to GPUs while delivering superior performance in AI tasks.

Common Uses of a TPU:

- Training deep learning models (e.g., neural networks)
- Accelerating AI applications like Google Search, Google Photos, and speech recognition
- Performing large-scale AI inference tasks efficiently

We didn't cover **TPU** in detail since we won't be using it much for now.

Differences Between CPU, GPU, and TPU

| Feature | CPU | GPU | TPU |
|-------------------|---|-------------------------------|-----------------------------|
| Processing Type | Sequential | Parallel | Optimized for AI |
| Best For | General computing | Graphics & parallel computing | Machine learning |
| Speed | Slower for parallel tasks | Faster in parallel tasks | Fastest in AI processing |
| Power Consumption | Moderate | High | Lower than GPU |
| Examples of Use | Operating systems, software, logic operations | Gaming, video processing, AI | Deep learning, AI inference |

Conclusion

- **CPUs** are designed for **general-purpose** tasks and handle complex logic.
- **GPUs** excel in **parallel processing**, making them ideal for **graphics rendering and AI workloads**.
- **TPUs** are **AI-specific processors** optimized for **machine learning and deep learning**.

Step 01: Introduction to Python

We started learning **Python fundamentals**, beginning with:

Why Learn Python?

Python is a **high-level, interpreted, and versatile programming language** known for its **simplicity and readability**.

- Supports **multiple paradigms** (procedural, OOP, functional programming).
- Used in **web development, AI, data science, automation, etc.**
- **Cross-platform** and beginner-friendly.

How Python Works (Compilation Process)

1. **Write Code** → in a Python file (.py extension).
2. **Compilation** → Python compiles the code into **bytecode**.
3. **Bytecode Execution** → The Python Virtual Machine (PVM) executes it.
4. **Machine Code** → The program runs on your computer.

What is Python Bytecode?

- Bytecode is an **intermediate representation** of Python code.
- It is **platform-independent** and stored in .pyc files.
- It helps Python **execute faster** without recompiling every time.

```

[2] class Person: # Class Person (source code/blue print of an object at runtime)
    def __init__(self, name: str, age: int): # initializer or constructor which is responsible to create Object in memory at runtime
        self.name = name # Person attribute
        self.age = age # Person attribute

    def greet(self): # Person Class method greet()
        print(f"Hello, my name is {self.name} and I am {self.age} years old.") # Print/Output to console/terminal

# Lets create a Person object in memory
person = Person("Sahir Ahmed Sheikh", 17)

person.greet() # Lets call Person Object's greet method
Hello, my name is Sahir Ahmed Sheikh and I am 17 years old.
```

To see the bytecode of a function, use:

```

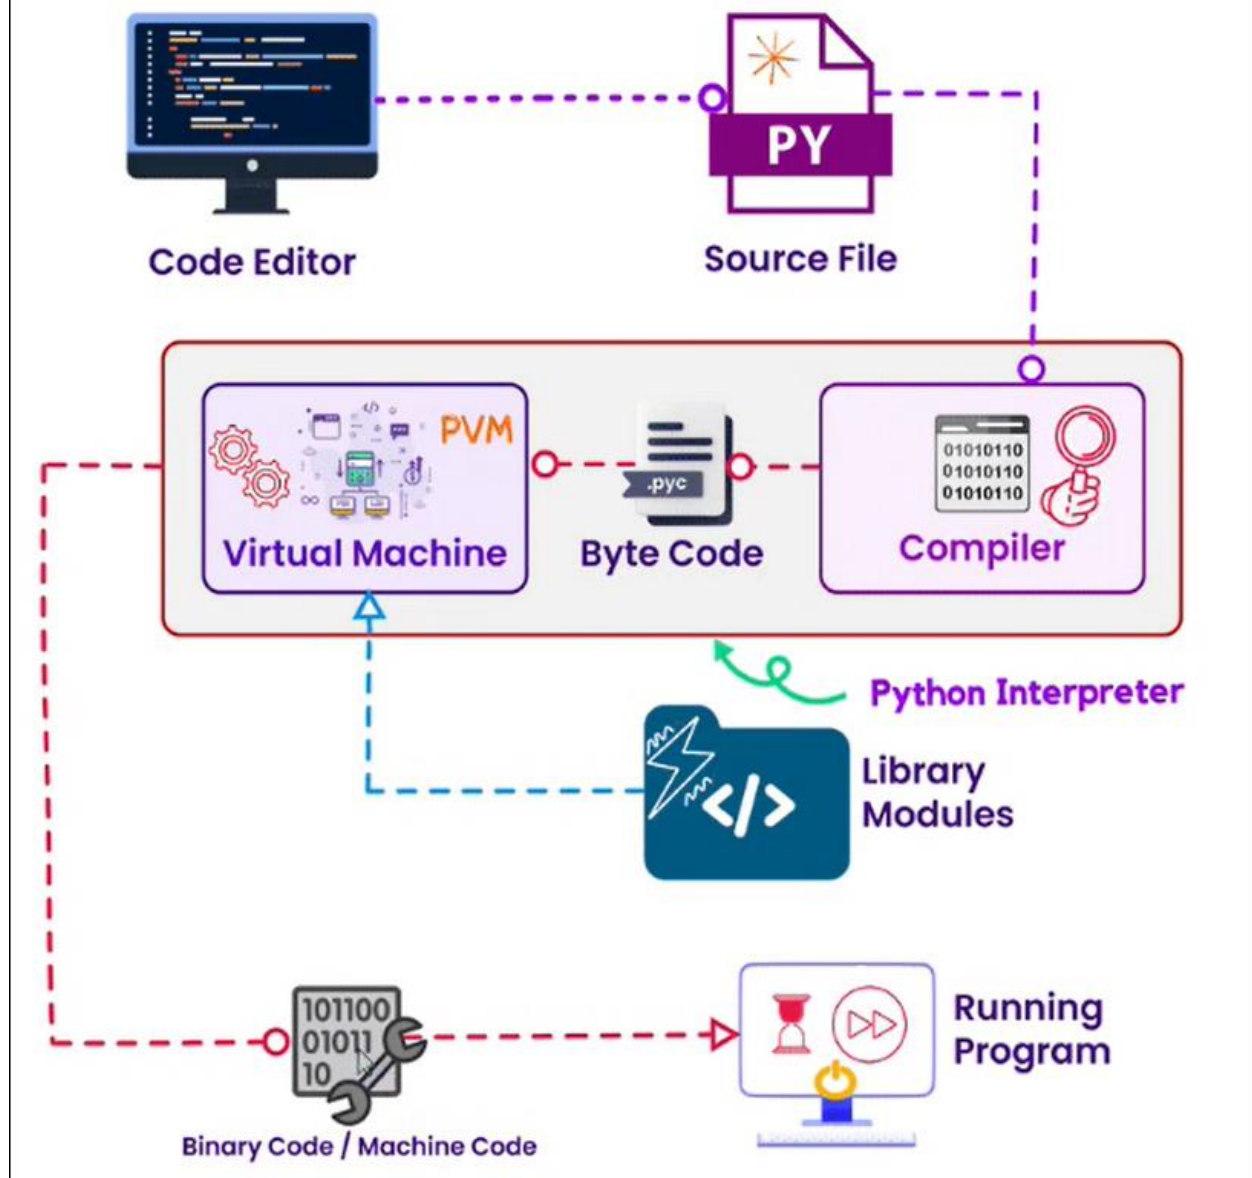

import dis
dis.dis(Person)

Disassembly of __init__:
2      0 RESUME      0
3      2 LOAD_FAST   1 (name)
4      4 LOAD_FAST   0 (self)
6      6 STORE_ATTR   0 (name)

4     16 LOAD_FAST   2 (age)
      18 LOAD_FAST   0 (self)
      20 STORE_ATTR   1 (age)
      30 LOAD_CONST  0 (None)
      32 RETURN_VALUE

Disassembly of greet:
6      0 RESUME      0
7      2 LOAD_GLOBAL  1 (MULT + print)
      14 LOAD_CONST  1 ('Hello, my name is ')
      16 LOAD_FAST   0 (self)
      18 LOAD_ATTR   1 (name)
      28 FORMAT_VALUE 0
      30 LOAD_CONST  2 (' and I am ')
      32 LOAD_FAST   0 (self)
      34 LOAD_ATTR   2 (age)
      44 FORMAT_VALUE 0
      46 LOAD_CONST  3 (' years old.')
      48 BUILD_STRING 5
      50 PRECALL    1
      54 CALL      1
      64 POP_TOP
      66 LOAD_CONST  0 (None)
      68 RETURN_VALUE
```

How Python Works

Why is Bytecode Important?

- **Cross-platform:** Runs on any system with Python installed.
- **Flexible:** Supports dynamic typing and modifications.
- **Caching:** Python stores .pyc files in `__pycache__` for faster execution.

Indentation in Python

Python **strictly follows indentation** for structuring code.

```
# Correct indentation
if True:
    print("Hello, World!")
    print("This is a block of code")

# Incorrect indentation
if True:
print("Hello, World!")
    print("This is a block of code")

# Correct indentation
def greet(name: str):
    print("Hello, " + name + "!")

# Incorrect indentation
def greet(name: str):
print("Hello, " + name + "!")
```

Best Practices:

- Always use **consistent indentation** (preferably 4 spaces).
- Avoid using **tabs**, as they may cause errors.
- Use an **IDE** with auto-indentation support.

Then we understood a bit about Python syntax—what a float is, what an int is, how functions are written in Python, and that an array is called a list in Python. After that, we wrote its code. I have shared the implementation code for all of this in the link below. Feel free to check it out:

Link: <https://colab.research.google.com/drive/12nR-IV-0aXvDaOlQghVHSIFOa1wv73T?usp=sharing>

Assignments Given:

✓ **Assignment 1:** Complete the first **7 steps** from the Panaverse Python repo.

[Learn Modern AI with Python](#)

✓ **Assignment 2:** Growth Mindset Challenge (Self-study)

[Growth Mindset Challenge](#)

✓ **Assignment 3:** Research and explain **Python Operators (is vs in)**

✓ Assignment 4: Agentic AI Presentation

Prepare a PowerPoint presentation on **Agentic AI** and upload it on **LinkedIn**.

Deadline: Before the next class

Submission: Upload all assignments on **LinkedIn**

This was our first class summary. We covered **Google Colab, CPU vs GPU vs TPU, Python compilation, Bytecode, Indentation rules, and python syntax.**

Next, we will continue learning more **Python fundamentals!**

Thank You for Reading!

Hope you understood Class 1 well.

"The beautiful thing about learning is that no one can take it away from you."

– *B.B. King*
